Change Password – Functional Workflow

Project: TaskFlow – Intelligent Task Allocation & Tracking System
Parent Module: Profile · **Child Module:** 07.2 Change Password
Version: 1.0 · **Last Updated:** 31-Oct-2026
Author: Jojo George (jojogeorge3344@gmail.com)

1. Overview

Change Password lets a signed-in user set a new password for their own account. Instead of asking for the current password, the change is confirmed with a code from the user's authenticator app (or a backup code). After a successful change the user is signed out on every device and must sign in again with the new password.

2. Purpose / Business Value

- Users can change their password safely without help from an administrator.
- The authenticator code proves who the user is, so a stolen session alone is not enough to take over the account.
- Signing out every session after the change ends any session an attacker may already have.

3. Who Can Access

Role	Can See	Can Use	Access Level (Own / Team / Organization)
Administrator	✅	✅ (needs two-step verification on)	Own
Manager	✅	✅ (needs two-step verification on)	Own
Employee	✅	✅ (needs two-step verification on)	Own
Custom Role	✅ (Always On)	✅ (Always On, needs two-step verification on)	Own

`profile.password.change` is **Always On** for every role and cannot be removed in Role Configuration. Only the user's own password can be changed here.

4. Screens

#	Screen Name	Menu Path	Purpose	Visible To
1	Change Password	My Profile → **Password** card → **Change password**	Set a new password, confirmed with an authenticator code	All signed-in users

5. Screen & Functionality Details

5.1 Screen: Change Password

Purpose: Let the user set a new password. The change is confirmed with an authenticator code.
Who can see this screen: All signed-in users. **Required permission:** `profile.password.change` (Always On)

Screen Elements

- **Back to profile** link.
- **New password** field with a show/hide (eye) button and a strength meter that shows Weak, Fair, Good or Strong.
- **Confirm new password** field with a show/hide button.
- Hint: *"At least 6 and at most 128 characters. Mix upper and lower case, numbers and symbols for a stronger one."*
- **Change password** button.
- **"Confirm it is you" popup:** an **Authenticator code** field (6-digit app code, or a backup code), **Cancel** and **Confirm** buttons. Confirm shows *"Changing..."* while it works.

5.2 Functionalities

#	Functionality	Purpose	Who Can See	Who Can Use	Permission Required	Scope
1	Change my password	Set a new password, confirmed with an authenticator or backup code	All signed-in users	All signed-in users who have two-step verification on	`profile.password.change`	Own
2	Password strength hint	Show how strong the new password is while the user types	All signed-in users	All signed-in users	`profile.password.change`	Own
3	Ask the Assistant about passwords	The TaskFlow Assistant explains how to change a password and links to My Profile. It never accepts a password in chat.	All signed-in users	All signed-in users	None (fixed guidance)	Own

5.3 Step-by-Step Workflow – Change My Password

1. User opens **My Profile → Password → Change password**.
2. User enters the **New password** and types it again in **Confirm new password**.
3. User clicks **Change password**. The system checks the length (6–128 characters) and that the two entries match. Nothing is sent yet.
4. System shows the **"Confirm it is you"** popup.
5. User enters the code from their authenticator app (or a backup code) and clicks **Confirm**.
6. System checks that two-step verification is on and that the code is valid. If so, it saves the new password.
7. System **signs the user out everywhere**, including the current browser, and opens the Login screen with the message *"Your username or password was changed. Sign in again with your*

new details."

8. If the code is wrong, the popup stays open with the error and the password is not changed. If the password itself is rejected, the popup closes and the error appears on the form.
9. No notification or email is sent.

5.4 Step-by-Step Workflow – Ask the Assistant about Passwords

1. User asks the TaskFlow Assistant (TFA) how to change their password.
2. The Assistant replies with fixed guidance and a link to **My Profile**.
3. The Assistant never asks for or accepts a password in chat. The change itself is always made on the Change Password screen.

Flow Diagram

5.5 Business Rules & Validations

- The new password must be **6 to 128 characters**. The server applies the same range as the login screen, so a password outside it could never be used to sign in.
- Both password entries must match. The screen checks this.
- **The current password is not asked for.** The authenticator code proves who the user is.
- **Two-step verification must be on.** Otherwise the change is refused with *"Set up two-step verification before changing your password."* While two-step setup is still pending, the password change is blocked together with most other screens.
- The code can be a 6-digit authenticator code or an unused backup code. A code that has been accepted once cannot be used again.
- After **5 wrong codes in a row**, code checks are locked for **5 minutes**. Sign-in uses the same counter.
- A successful change ends **every session** of the user on every device. The user must sign in again with the new password.
- The strength meter is only a hint. The only rule the server enforces is the length.

5.6 Messages Shown to the User

Situation	Message
Success	The user is signed out. Login screen: *Your username or password was changed. Sign in again with your new details.*
Field empty	Required.
Password too short	Password must be at least 6 characters.
Password too long	Password must be at most 128 characters.
Passwords differ	Passwords do not match.
Code missing	Enter the code from your authenticator app.
Code wrong or expired	The code is incorrect or has expired.
Too many wrong codes	Too many wrong codes. Try again in a few minutes.
MFA not set up	Set up two-step verification before changing your password.
Code rejected, no reason given	That code did not work. Try the new code from your app.

Situation	Message
Password rejected, no reason given	Could not change your password.

6. Permission Summary

Permission Key	Description	Administrator	Manager	Employee	Custom Role
`profile.password.change`	Change my password – change the user's own password	Always On	Always On	Always On	Always On

This key is given to every user automatically. It is not stored per role and cannot be assigned or removed in Role Configuration.

7. Related Modules

- **07.1 User Profile** – The Change Password screen is opened from the Password card on My Profile, and **Back to profile** returns there.
- **07.3 Two-Step Verification** – Two-step verification must be on before a password can be changed. The same wrong-code lock applies.
- **Authentication** – After a password change the user signs in again on the Login screen. Account Recovery is the route for a forgotten password.
- **TaskFlow Assistant (TFA)** – Explains how to change a password and links to My Profile.

8. Expected Outcome

Every user can change their own password safely: the change is confirmed with an authenticator code, and all of their sessions are ended so they sign in again with the new password.
